HR Agency: Agency Plan

Autonomous AI Employees for sourcing, resume parsing, onboarding and pipeline management | Built on markfulton/ai-employees | 3 November 2026

1. Chosen agency type

HR Agency. The agency runs the recruiting-to-onboarding workflow for a growing company: it sources candidates, parses resumes, stages them in a pipeline, drafts job descriptions and outreach, prepares onboarding tracks, measures the funnel and audits data quality. Eight employees work on a weekday schedule (Asia/Karachi). Each is a folder of scheduled routines in the ai-employees format (ROLE.md, SKILL.md), runs on Claude Code, and holds every outbound action for the owner.

2. The 8 employees and their mapped tasks

#	Employee (role)	Mapped tasks	Output	Fires
1	**hr-chief-of-staff (Project Manager)**	Audits all 7 agents, logs every run to the Google Sheet ledger, emails the daily brief with attention flags and missing runs.	Sheet rows + email	18:00
2	**talent-sourcer (Lead Researcher)**	Turns each open requisition into boolean search strings, channel list and weekly outreach caps.	sourcing_plan.md	09:00
3	**resume-parser (Data Parser)**	Extracts name, contact, skills, education and years of experience from raw resumes into structured records.	candidates.json	09:30
4	**jd-outreach-writer (Content Writer)**	Writes inclusive job descriptions and personalised outreach drafts. Every draft is held for approval.	JDs + drafts	10:00
5	**pipeline-manager (Campaign Builder)**	Scores candidates against requisitions (70 required, 20 nice-to-have, 10 experience) and assigns pipeline stages.	pipeline.csv	11:00
6	**onboarding-coordinator (Onboarding)**	Builds a dated 30/60/90-day checklist for each accepted hire, with day-1 access tasks.	onboarding_*.md	12:00
7	**hr-analyst (Performance Analyst)**	Computes funnel metrics and flags bottlenecks, such as too few shortlisted candidates for open headcount.	funnel_metrics.json	15:00
8	**compliance-auditor (Technical Auditor)**	Checks invalid emails, duplicates, claimed vs computed experience, and biased wording in job descriptions.	audit_report.md	16:00

3. Project Manager automation

- Google Sheet ledger: every run from every employee appends one row with the columns Timestamp | Agent Name | Task Performed | Output Status, through scripts/runlog.mjs, scripts/sheet_bridge.mjs and a Google Apps Script web app (apps-script/Code.gs).
- Daily email: the Chief of Staff builds a scannable bulletin (agents reported x/8, needs-attention list, one line per agent) with scripts/daily_brief.mjs. It is sent to the owner via Apps Script MailApp. A time trigger in the same script sends the brief from the Sheet if the local machine is off.

4. Guardrails and success measures

- Nothing is sent to candidates; outreach and welcome emails are drafts held for approval. No credentials are stored. The run logger rejects records containing emails, phone numbers, URLs or secrets.
- Success: 8 of 8 agents log a run each weekday, the daily email arrives, no agent is missing, and the auditor reports zero unresolved data issues before a candidate is contacted.
